

# UnderLine<sup>®</sup>

## GEL DELIVERY SYSTEM FOR PIGS

### VACCINES • PROBIOTICS • NUTRITIONALS

#### ADVANTAGES

- Gel formula ensures uniform suspension
- Easy to mix soluble powder, simply add cool tap water
- Perfect for insoluble ingredients
- Gel is highly palatable and readily consumed by pigs
- Buffers both acidic and alkaline pH levels to neutral
- Instantly neutralizes harmful effects of chlorine and other oxidizers
- Perfectly balances tonicity for optimal electrolyte balance

#### DIRECTIONS FOR USE

Prepare Gel by vigorously mixing each 80g pack of UnderLine into 1 gallon (3.8 liters) of water. Add the desired amount of cool tap water to the mixing vessel first, then add UnderLine slowly to the water while stirring and mix thoroughly.

Allow the gel to stand and hydrate for 10-15 minutes to achieve optimal viscosity before adding other dry additives.

UnderLine gel can be used to suspend oral additives such as probiotics, vaccines, and nutritional ingredients for baby pigs in the farrowing crate. Thoroughly mix the desired active ingredients into the stabilized gel solution at the manufacturer's recommended dose rate.

The active ingredients required to dose one litter of pigs should be mixed into each 125 ml of gel solution. Uniformly spray/apply 125 ml of gel on each sow's underline while she is standing, or top-dress the gel on floor mats, in feed pans or a surface that allows for pigs to consume it. Repeat for successive applications as required for the active ingredient.
